

Al-Aqsa University-Gaza

Department of Network Information Technology

Course: Data and System Security

Instructor: Eng. Baraa Sahmoud

 **Final Project**

Project Overview

In this project, you will design and test your Personal Cybersecurity Plan. This is your chance to apply what you've learned in class — including encryption, password safety, link analysis, and more. You'll also explore new tools beyond what we practiced together, and explain your experience through a simple video.

1. Self-Assessment Table

Fill in the table with honest examples about your current digital habits.

Topic	My Current Practice
Password Management	
Two-Factor Authentication	
File Encryption	
Suspicious Link Detection	
Hashing Awareness	
Software Updates	
Cloud Storage Security	
Wi-Fi Security	
Antivirus Use	
Password Storage	
Social Media Privacy	
App Permissions	

✓ 2. Your Personal Security Plan

Choose 4 different tools or websites to help improve your digital security.
Each tool must belong to a different category from the ones below:

-  **Encryption & Hashing tools**
-  **Password safety or password manager**
-  **Suspicious link or file analysis**
-  **Information Gathering tools**

For each tool, include:

- Tool/Website Name
- What it is used for
- Why you chose it

⚠ **Important:** Use new tools only (not the ones we covered in class).

✓ 3. Tool Testing & Screenshots

Choose any 2 tools from your list to try.

Include screenshots for the following:

-  If encryption/hash tool:
 - File/text before and after encryption/decryption
 - Input before and after hashing
-  If password manager:
 - Password creation or strength check
 - Screenshot of the manager/dashboard
- ☐ If suspicious link or file scan:
 - The scanned link/file and the analysis result
-  If information gathering tool:
 - The target input (domain, IP, etc.)
 - The result (scan, info, metadata...)

✓ 4. Video Explanation (Required)

You must record a short video (any length) explaining your full project.

 In the video, explain:

- Your answers in the file
- The 4 tools you selected
- What you tested and what the screenshots show
- What you learned from the whole experience

📌 If you recorded a video, include the link in your file:

Video Link: <https://drive.google.com/yourlink>

✓ Make sure it works before submitting.

📌 If you cannot record, contact with me to schedule a live discussion.

💡 Notes for Students Without a Laptop

You can complete the project using only websites/tools that work in mobile browsers.

- Use online tools for encryption, password checking, hashing, scanning, etc.
- Take screenshots of your work and attach them
- You may use your phone to record the video
- If unable to record, contact with me.

⚠ Important Guidelines

- ✗ No copy-paste or AI-generated answers. Write in your own words.
- ✓ Your file (Word or PDF) must include everything:
 - Assessment table
 - 4 tools with explanation
 - Screenshots of 2 tested tools
 - Video link
- Without video or instructor discussion = project is incomplete
- You may use ChatGPT or similar tools for help, but no copying
 - The questions are personal and must reflect your thinking
 - You will explain them in the video
